

A World of Open Science

**The geography of a world where science is done in
the open and for the greater good**

by: Mozilla Science Lab

In the early 21st century, a scientific revolution occurred which toppled the established methods of doing and disseminating scientific knowledge - this was called the La Revolution D'Access Pour Tous (The Open Access Revolution). The revolution was in effect a response to the mounting pressures from global climate change and the spread of antibiotic resistant viruses that pressed the world - scientists and the public alike - to work together to develop innovative and holistic solutions. Since the revolution, open science has become the dominant paradigm leading to a new geography of science.

Let's look at how science is happening around the world!
